BACKGROUND

Coaching and feedback are essential in any field to guide professional development.

Performance management is made up of three elements: employee assessment, feedback, and coaching, all three of which responsibilities generally fall on the manager.

The manager-as-coach tool plays an essential role in the effective management and development of employees.

The manager-as-coach model entails the process of providing feedback, setting goals, and assessing progress.

PURPOSE

We discuss the role that the utilization of coaching and feedback techniques can serve within the field of radiology in improving productivity, overall performance, and employee engagement.

METHODS

Constructive feedback and coaching create a culture of greater innovation where learning and creativity are prioritized over perfectionism.

In an environment where employees are not shamed for their mistakes but instead given guidance on how to do better, performance and productivity are optimized.

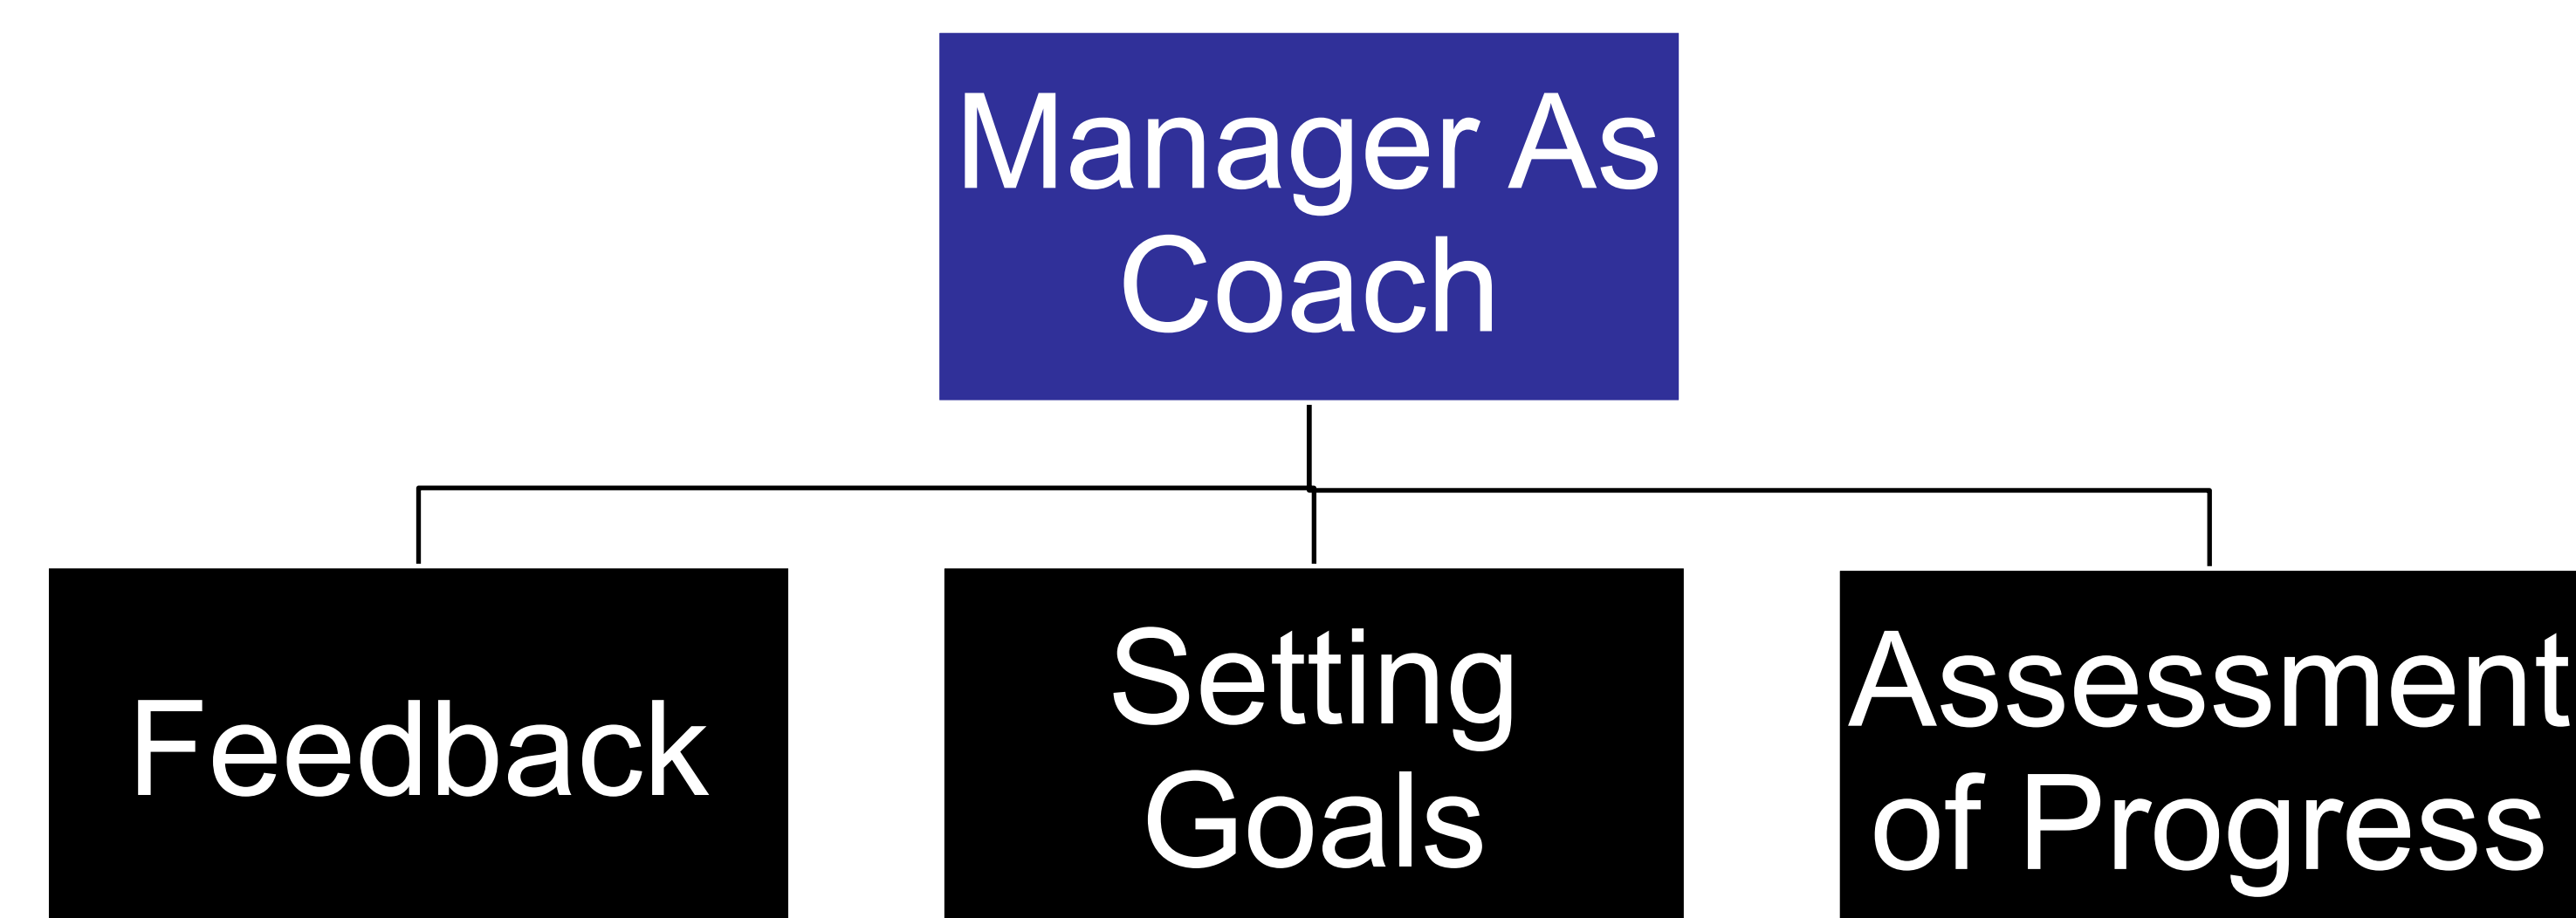

We discuss the importance of providing these constructive ideas in the radiology workplace.

RESULTS

Fig 1. Effects of Constructive Feedback and Coaching

Fig 2. How Coaching Affects Performance

Within the manager-as-coach model, feedback has been demonstrated to be a critical element of the coaching process.

Within the field of radiology, especially in residency training settings, the concepts of coaching and feedback can be implemented to set up a formal or informal mentor-student dynamic.

RESULTS CONTINUED

Together, these frameworks motivate employees, improve performance, and increase engagement of subordinates as a team together with their manager coaches.

This can improve productivity within a fast-paced environment, as occurs in the radiology workplace.

CONCLUSIONS

Harnessing the techniques of coaching and feedback is critical in fostering an environment of greater creativity, learning, and teamwork.

Prioritizing the implementation of these ideas in the field of radiology is crucial for increasing productivity and thereby improving outcomes within healthcare settings.
