Connell School of Nursing at Boston College, Chestnut Hill, MA; ⁵Louise Herrington School of Nursing, Baylor University, Dallas, TX

Background & Aims

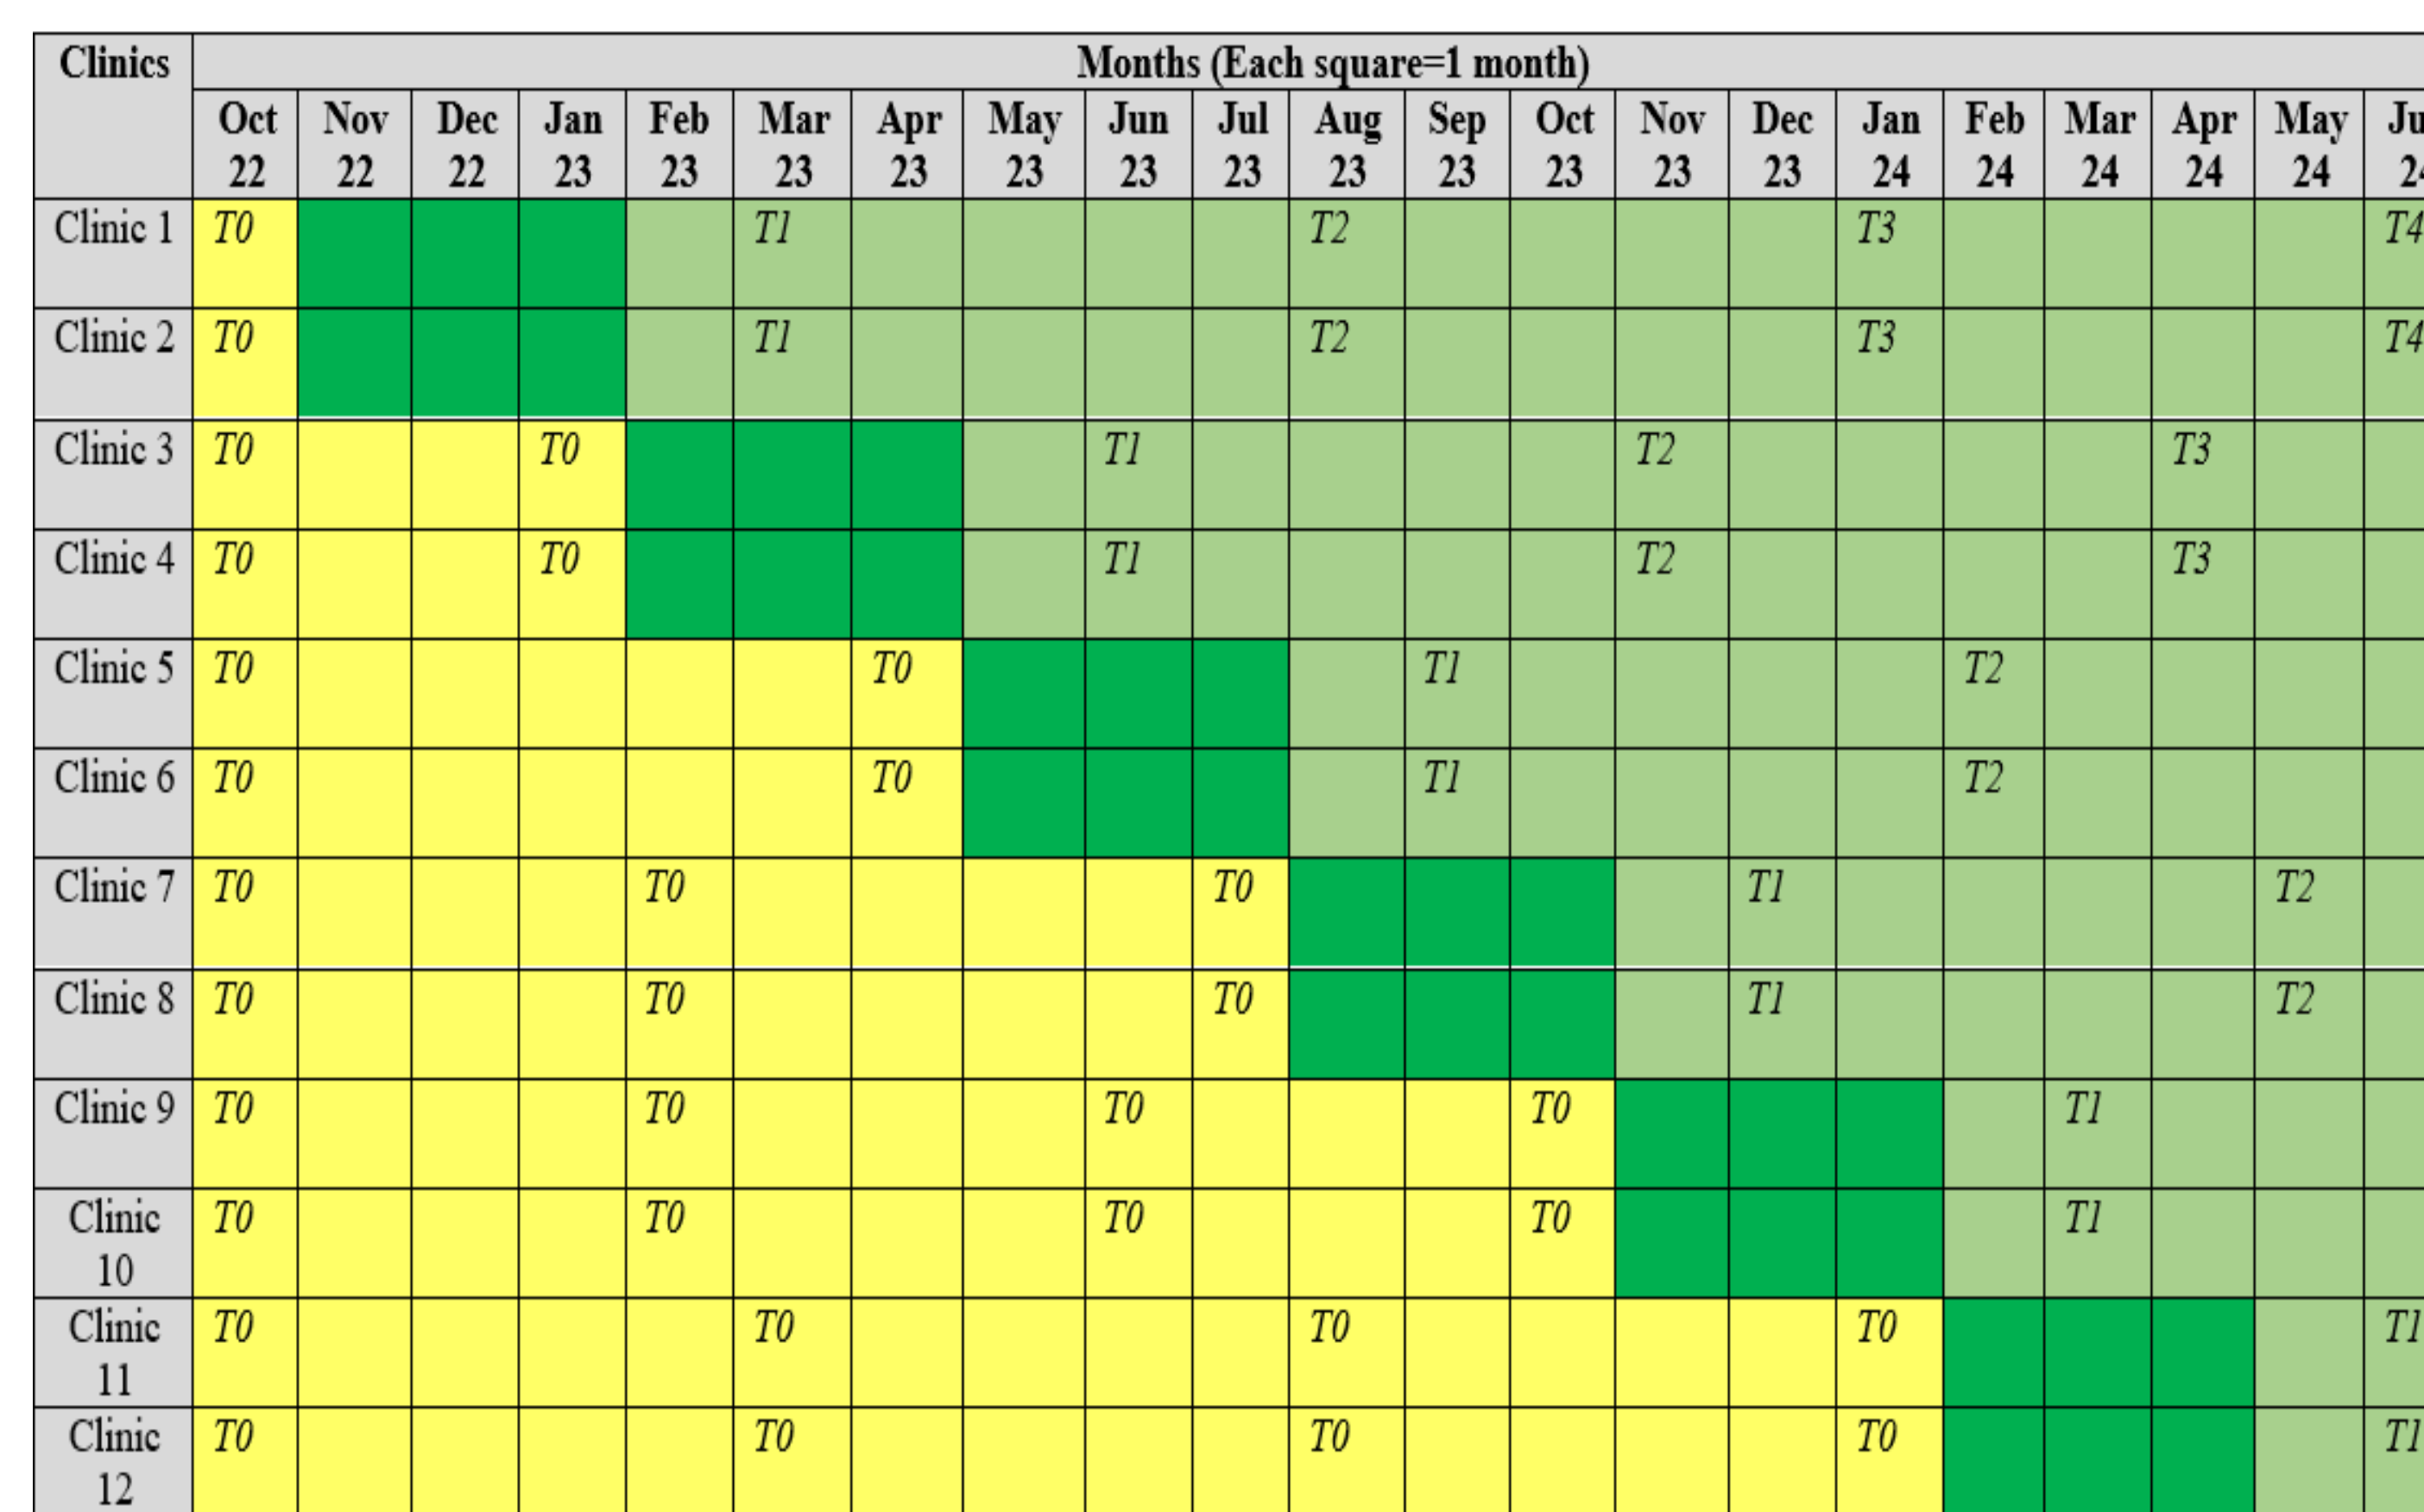

Asian Americans are 40% more likely to be diagnosed with diabetes than non-Hispanic Whites (NHW) and 60% more likely to be diagnosed with end-stage renal disease.¹ Vietnamese are at greater risk, with 60% higher odds of diabetes compared to NHW.²

- Participation in a DSMES program improves quality of life, health outcomes, self-care behaviors and HbA1c.^{3,4}
- Language, culture, ethnic differences are some of the barriers to program participation.
- We developed and pilot testing an mHealth intervention to educate and support diabetes self-management for Vietnamese with T2D (dsm-V) and utilizing the RE-AIM framework to measure outcomes.

- Aim 1:** Test the acceptability & feasibility of the dsm-V intervention.
- Aim 2:** Determine intervention effectiveness & assess its sustainability.

Study Design

Stepped wedge study design with staggered enrollment (Target N=80 patients in 12 clinics in Central Oklahoma)

Results 11/8/22-6/19/23 (Study in Progress)

Patient Demographics

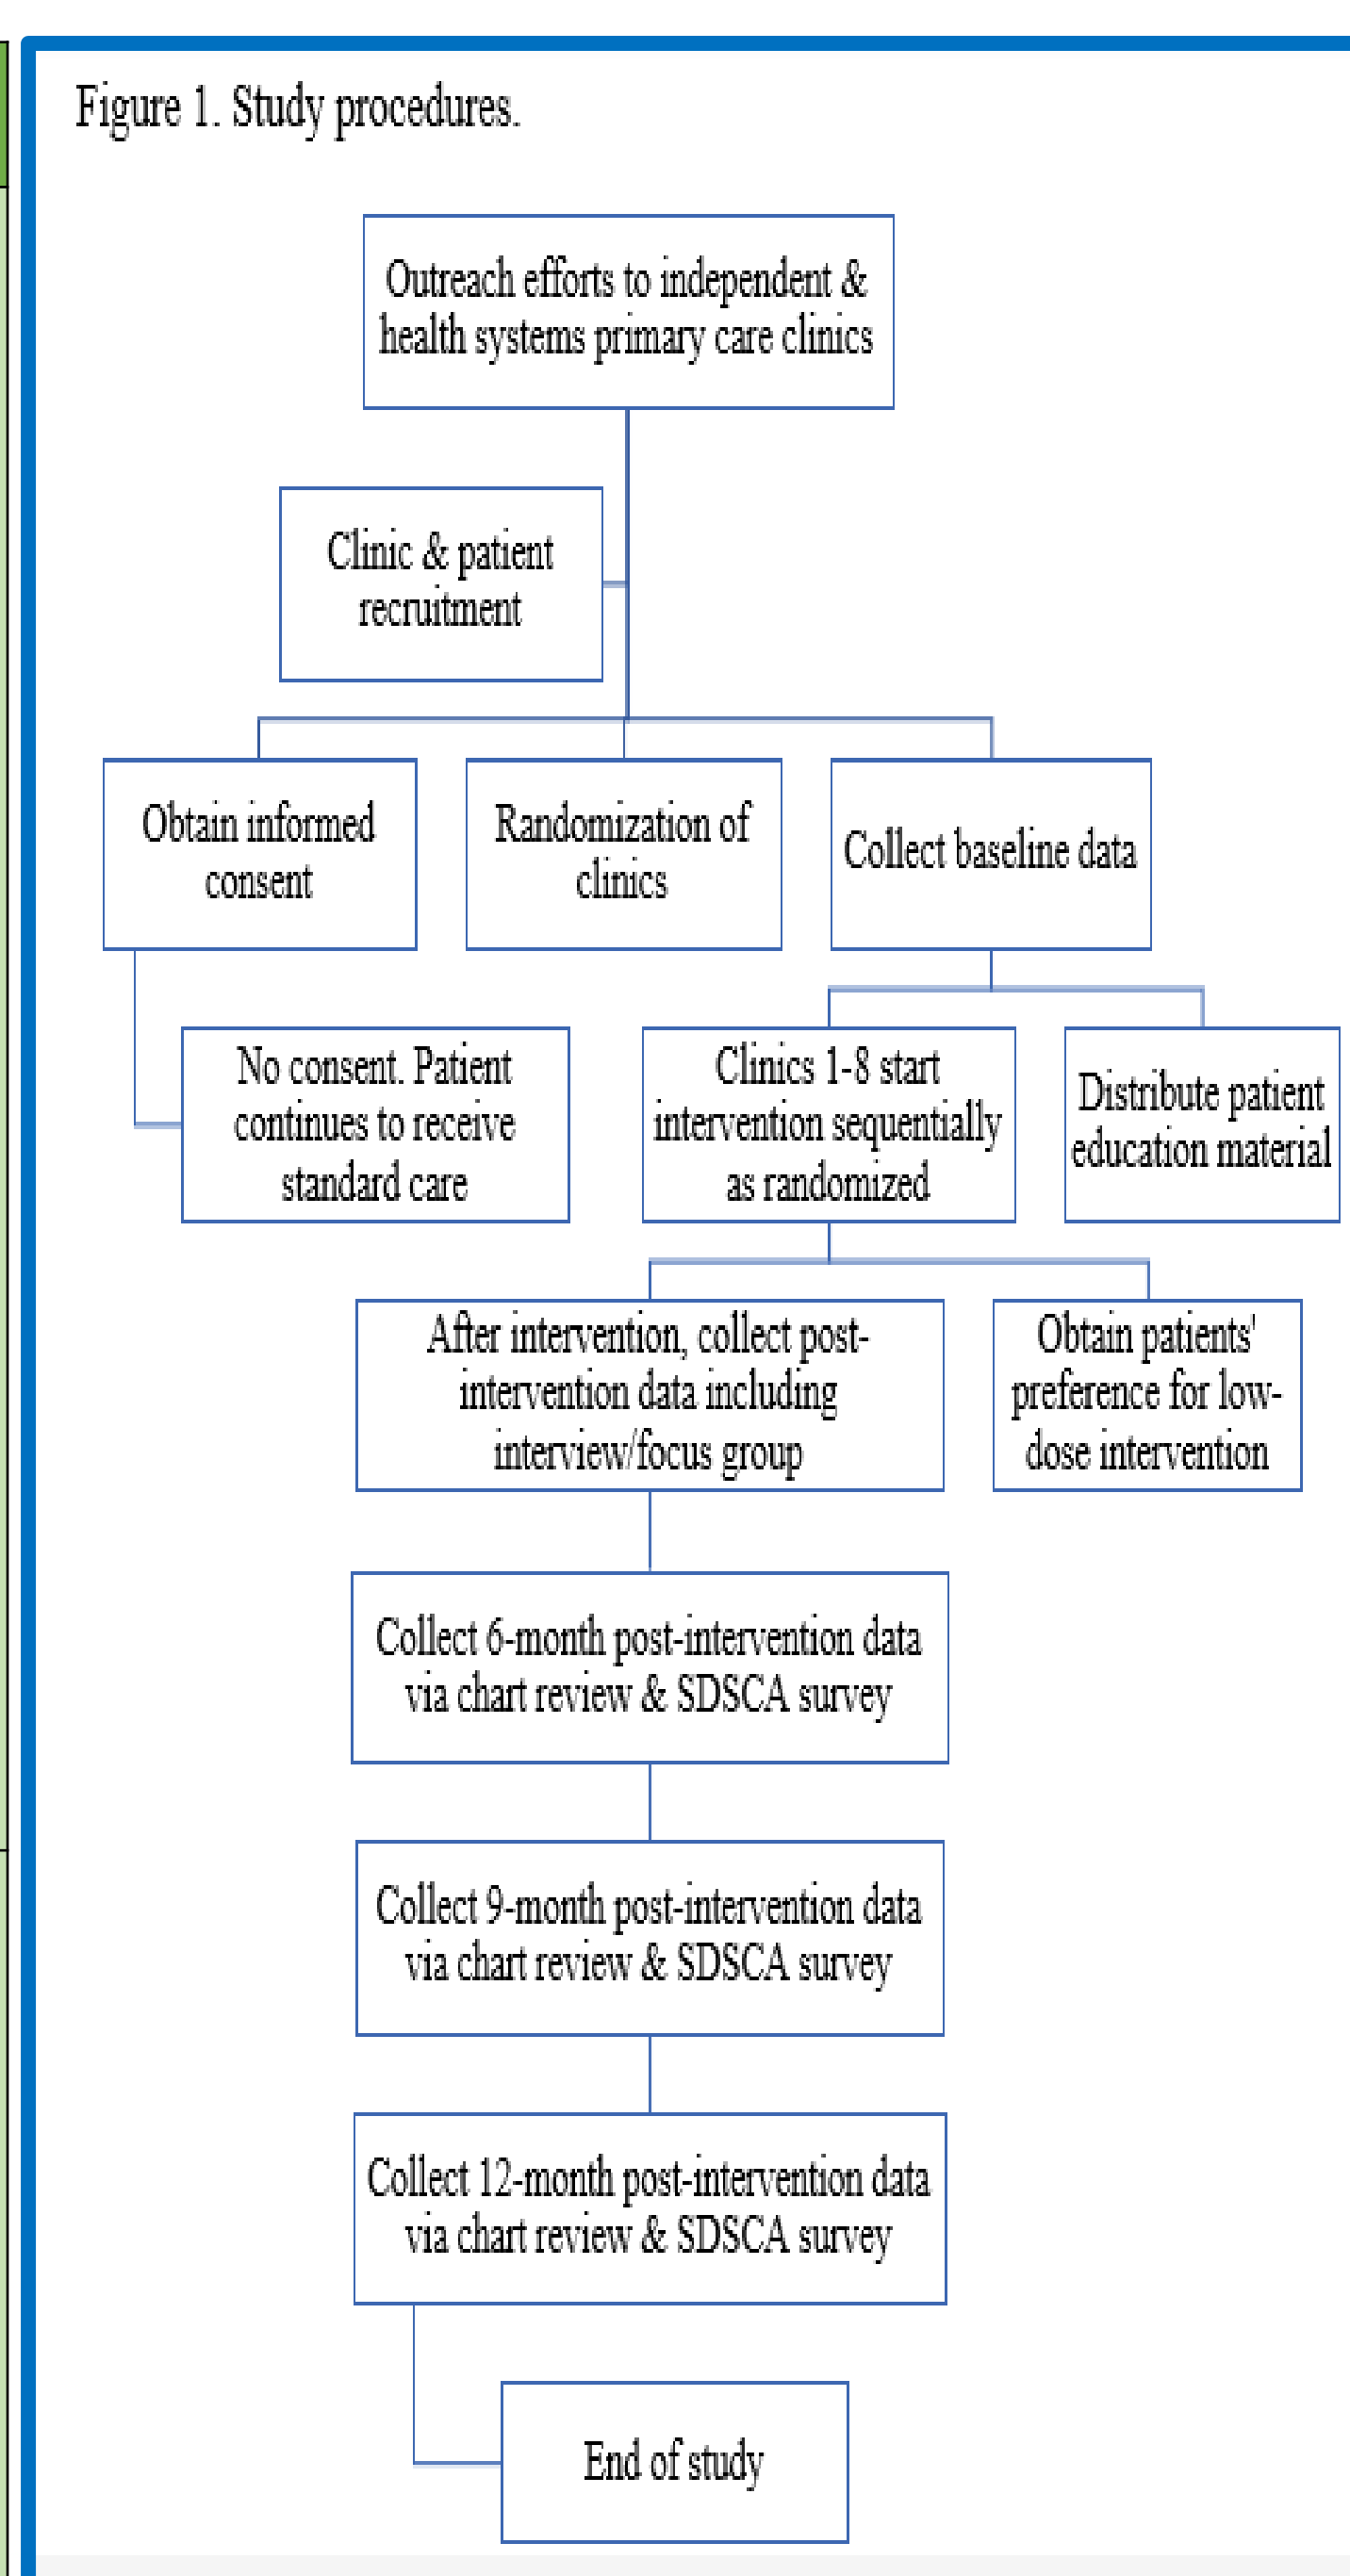

Male	Female	Age	Yrs with T2D		Had prior DSMES
N=23 (51.11%)	N=22 (48.89%)	66.71	0-1yrs n=3 (6.67%)	2-3 yrs n=7 (15.56%)	Yes: n=2 (4%)
			4-5 yrs n=7 (15.56%)	6-7 yrs n=6 (13.33%)	No: n=43 (96%)
			8-9 yrs n=4 (8.89%)	>9 yrs n=18 (40.00%)	

RE-AIM Domain

Reach	Effectiveness @3m F/U (n=22)		Adoption	Implementation
• N=45/80 pts	HbA1c: 0.59	LDL: 0.50	67% clinics enrolled	• Nurse checklist
• N=8/12 clinics	BMI: 0.40	HDL: 0.36		• Daily SMS
• Barrier: Health system approval (clinic); research hesitation (pt)	Triglyceride: 0.63	BP: 0.59	• Barrier: Paper chart (clinic); no cell phone (pt)	• Barrier: Staff time (clinic); time for nurse call (pt)
• Facilitator: MD referrals (pt)	Weight: 0.59		• Facilitator: Service/resource (clinic & pt)	• Facilitator: SMS with return (pt)
	SDSCA Questionnaire:			
	Diet: 0.36	Monitor: 0.31		
	Exercise: 0.18	Foot care: 0.40		

Methods & Study Procedures

	V-dm Intervention	RE-AIM Domain	Outcomes
Aim 1	<ul style="list-style-type: none"> ❖ Printed handbook, daily SMS, & weekly coaching nurse calls. ❖ 12 weeks of synchronous & asynchronous intervention. ❖ Empowerment & Health Belief Model. ❖ A low-dose of SMS & nurse call after 12 weeks (Nudge Theory). 	<ul style="list-style-type: none"> ❖ Reach: Absolute number of participants in the intervention. ❖ Adoption: Intervention adoption at clinic and patient level. ❖ Implementation: Key features of program delivery. ❖ Maintenance: Clinics sustain the program & patients maintain improved outcomes. 	<ul style="list-style-type: none"> Reach: <ul style="list-style-type: none"> • % of participants responded to ≥50% SMS & nurse calls at end of program. • Barriers & facilitators to reach. Adoption: <ul style="list-style-type: none"> • % of eligible clinic sites who participated. • Barriers and facilitators to adoption. Implementation: <ul style="list-style-type: none"> • Fidelity to the protocol. • Barriers & facilitators to implementation. Maintenance: <ul style="list-style-type: none"> • Sustainability of intervention. • Sustainability of improved outcomes.
Aim 2	<ul style="list-style-type: none"> ❖ Evaluates pre- and post-intervention measures at 3, 6, 9, and 12 months from baseline. 	<ul style="list-style-type: none"> ❖ Effectiveness: Modification in self-care (SDSCA scale) and improvement in biological markers (HbA1c, BP, BMI, & lipid). 	<ul style="list-style-type: none"> Effectiveness: <ul style="list-style-type: none"> • Changes in SDSCA scale. • Changes in HbA1c, triglyceride, LDL, HDL, BMI, BP, weight. • % of patients enrolled at end of study period.

Lessons Learned

- Impact of culture on study design
- Strengths & limits of the stepped wedge
- Relevancy of intervention development
- Teaching & learning modalities
- Value of health outcome measures
- Collaboration with large health systems
- Challenges & facilitators with solutions for:
 - ✓ Technical problem with mHealth
 - ✓ Practical problem with recruitment & enrollment
 - ✓ Methodological problem with 1:1 consultation
 - ✓ Implementation problem with internet & data
 - ✓ Acknowledgement of clinic staff time

Conclusions

- This study addresses the urgent need to evaluate linguistically and culturally relevant diabetes intervention that maximizes self-care behaviors and maintains clinical effectiveness among ethnic minority populations.
- This is the first Vietnamese diabetes intervention that leverages mHealth technology to address the barriers through collaborating with primary care clinics.
- Successful study results may be implemented across other localities and states and across both primary care and specialty clinics.
