

Social Network Influence on Individual Interest to Uptake Diabetes Prevention Program: Preliminary Study

Shinduk Lee,^{1,2} Sara E Simonsen,¹ Bryan Gibson¹ 1 University of Utah; 2 Texas A&M University

INTRODUCTION

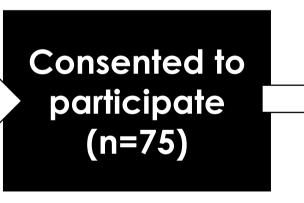

- Nearly 96 million US adults are estimated to have prediabetes and are at high risk of developing type 2 diabetes.
- Intensive lifestyle education and support can reduce the risk of developing diabetes.
- Gaps:
 - Low rates of participating in diabetes prevention program (DPP) diminish its public health impacts.
 - Limited understanding of how individuals make DPP enrollment decisions – especially related to their social contexts
- <u>Objective</u>: To examine effects of social norms on individual's interest in enrolling in the DPP

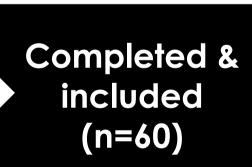

METHODS

- Built on existing 3-armed RCT examining different strategies intended to promote DPP enrollment.
- A sub-group of RCT participants were invited to complete an online, cross-sectional survey

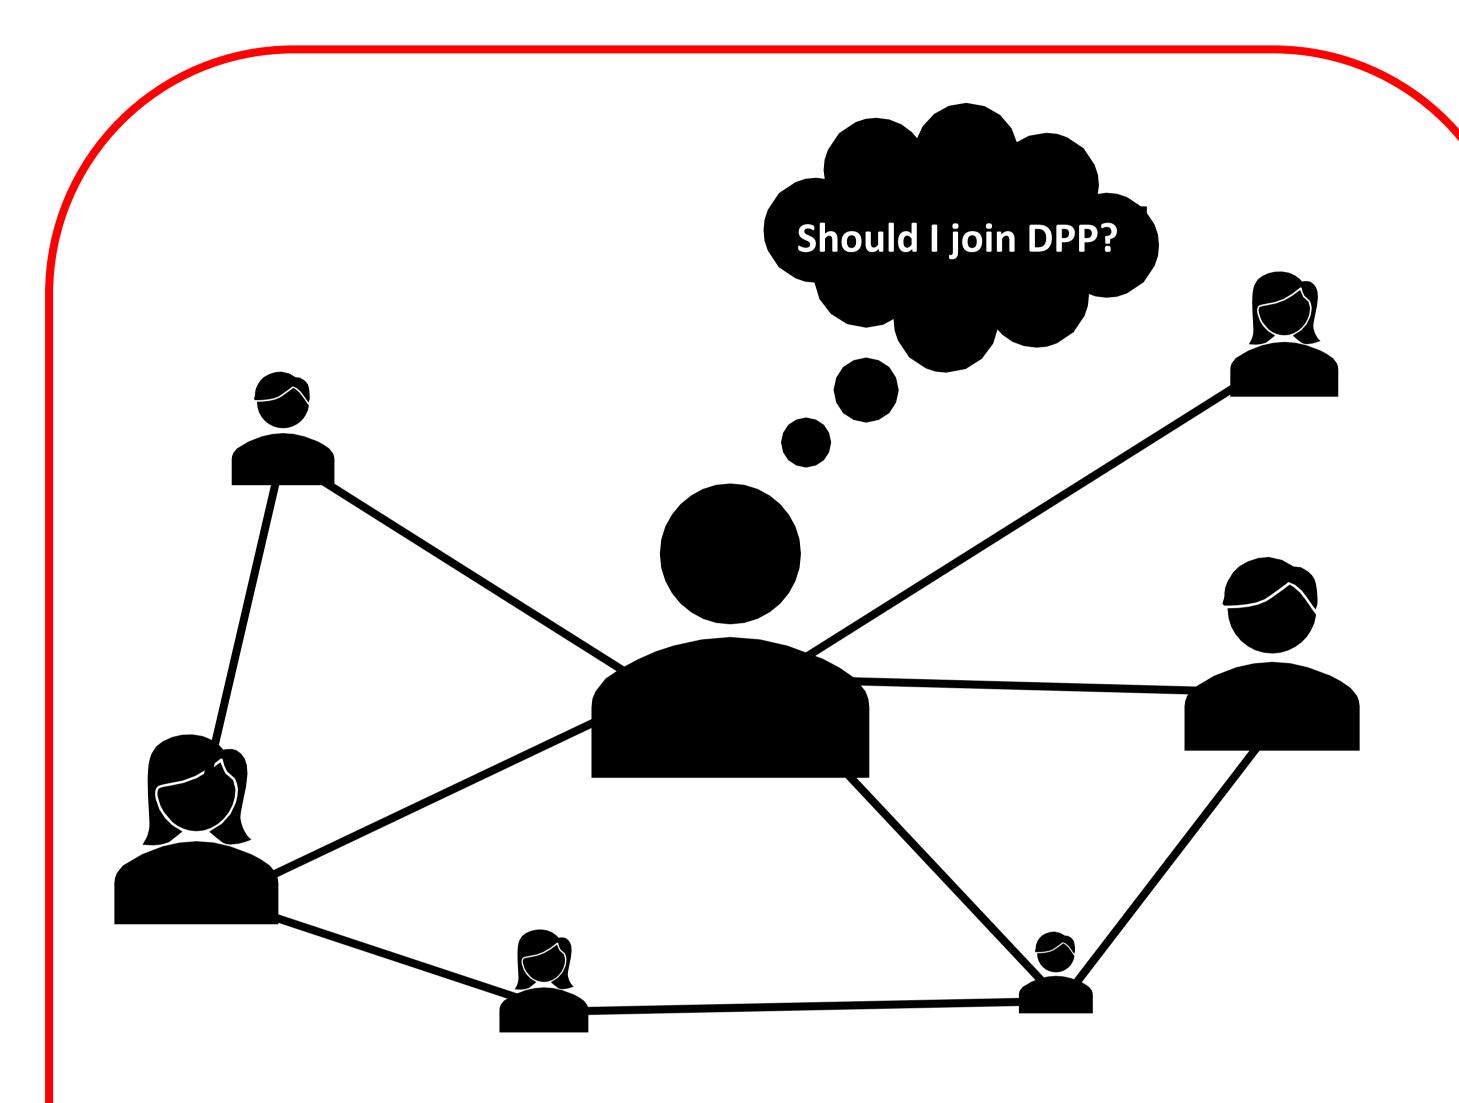

Survey invitation sent (n=157)

- Outcome variables:
 - Request to be referred to DPP (n=23)
 - Interest in enrolling in DPP (n=47)
- Survey data
 - Multiple name generators
 - Whom discuss important matters with
 - Whom discuss health issues with
 - Whom spend most time with
 - Whom feel close to
 - Social network member descriptors
 - Demographic characteristics
 - Relationship
 - Subjective (Approving/Being supportive of/Encouraging) and descriptive norm towards DPP participation

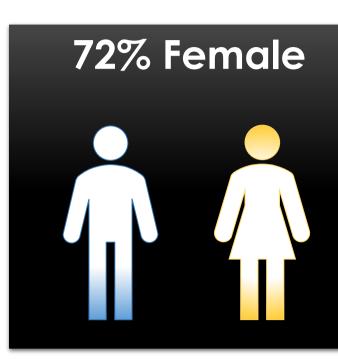

Key takeaways:

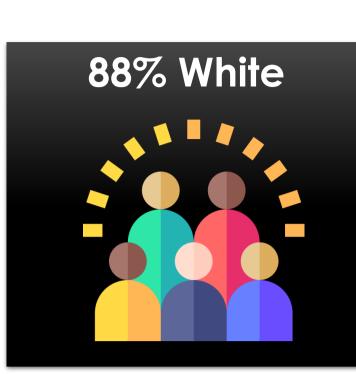

- Social network environment may contribute to individual decision to be referred to DPP.
- Larger study is needed to better characterize the social network determinant that can be leveraged to facilitate DPP enrollment.
 - E.g., Would indirect recruitment through network members be feasible and effective in boosting enrollment in DPP among adultsat-risk?

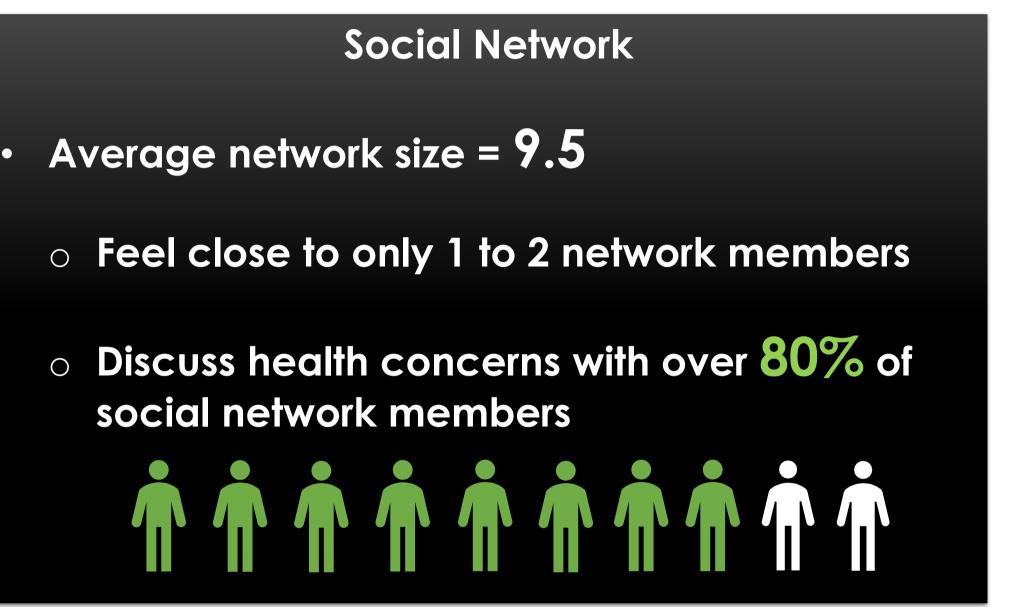

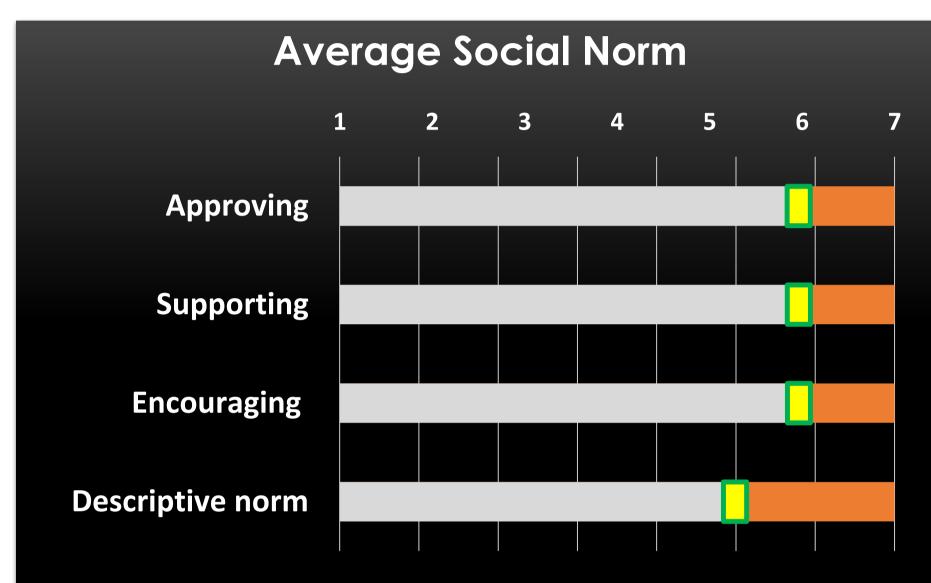

Table 1. Independent group t-test for comparing subjective and descriptive norm scores from network members whom study participants discuss their health concerns with: (a) refer vs. not to refer; (b) interested vs. not interested

Meai	Mean <u>+</u> SD			
Refer	Not to refer	t	Cohen's d	P

Descriptive Norm	5.37 <u>+</u> 1.08	5.35 <u>+</u> 1.01	0.06	0.02	0.955

DISCUSSION

- While preliminary, the study describes potential social network influence on individual decision to be referred to DPP.
- Implications for future study
 - Larger study to confirm the study finding
 - O Who are the network members whom adults at risk discuss health concerns with?
- Limitations
 - Small sample size
